- a sliding block interiorly provided with sliding groove for balls to roll;
- an end-cup fixed to both ends of the sliding block for circulation of the balls, the end-cup provided with a notch;
  - a ball retainer, at both ends of which respectively provided with a tongue member which can be inserted in the notch so as to fix the ball retainer, at a middle portion of the ball retainer formed with an extension, on the extension defined with a locating pin and employed to be fixed to a bottom of the sliding block, so as to improve whole geometric strength of the ball retainer, and prevent deformation of the ball retainer.
  - 2. The slider of linear guideway as claimed in claim 1, wherein an inverted hook structure is defined in the notch.
  - 3. The slider of linear guideway as claimed in claim 1, wherein the tongue member at both ends of the ball retainer is hook-shaped.
  - 4. The slider of linear guideway as claimed in claim 1, wherein the ball retainer is not fixed with screws and bolts.
- 5. The slider of linear guideway as claimed in claim 1, wherein the ball retainer is made by plastic ejection molding.
